A GENERAL DESCRIPTION OF PROJECT ACTIVITY

A.1 Title of the project activity

Mondi Richards Bay Biomass Project

A.2 Description of the project activity

Collection and recovery of biomass waste at Mondi Business Paper, Richards Bay mill, for use in the generation of renewable energy as an alternative fuel to coal. The proposed project consists of two activities:

- Project activity 1: Recovery of biomass waste that consists of fines, wood chips, logs etc. presently being landfilled at a Richards Bay Municipal Landfill site and some plantation waste currently left in the plantations to decay.
- Project activity 2: Usage of the biomass waste in biomass generated power boiler as an alternative fuel to coal to generate steam at Mondi Richards Bay.

Mondi SilvaCel and other timber processors (chippers) in the area of Richards Bay presently transport and landfill their biomass waste at a local municipal landfill site. With the implementation of the project activity 1, these operations will no longer landfill biomass waste. In addition, other potential sources of biomass waste from surrounding plantations (stumps, off-cuts and branches) normally left in the plantations could be recovered and used as a fuel.

Comment on plantation waste

Methane formation from the decay of plantation waste has been included in the scope of the Project Design Document. Methane emission factors for plantation waste have not been confirmed, but if confirmed these will be included and be subjected to verification prior to issuance of credits. The PDD makes provision for this.

Coal fired boilers are presently used at Mondi Richards Bay to generate heat and electricity for the production of pulp and linerboard. If necessary, modifications will be done to existing precipitators in order to handle particulate emissions from the additional biomass load in the boiler and to ensure that emissions from the biomass boiler complies with national legislation.

Recovered biomass waste, which is currently being landfilled and other potential recovered biomass from plantations will be used as a renewable energy resource in a co-fired boiler thereby eliminating coal consumption during normal operations. The biomass boiler is being utilised below capacity and can accommodate an additional 250 tonnes per day. This will result in the reduction of Greenhouse gas emissions from fossil fuel for the boiler. In addition, methane emissions from landfilling biomass waste and methane emissions generated by plantation waste will be avoided. The resulting emission reductions will be monitored and verified against the proposed project activity baselines.

A.2 Sustainable Development Screen

This project has been assessed by means of two related sustainable development screens, i.e.:

- The SouthSouthNorth Sustainable Development Appraisal and Ranking Matrix Tool, and
- The Gold Standard Sustainable Development Assessment¹

These assessments both indicate a positive contribution by the project toward local and national sustainable development. The outcome of these assessments is illustrated in the table below.

¹ This project was designed in the absence of a South African DNA, and sustainable development rules. The Gold Standard Matrix was thus applied as a decidedly stringent screen in order to minimise risk.

Table 2: ²The SouthSouthNorth Sustainable Development Appraisal and Ranking Matrix Tool

Sustainability Indicators	Score	Comments
Indicator 1 - Contribution to the mitigation of Global Climate Change	3	Against a baseline the estimated reduction of emissions is approximately 1217 kilotonnes CO ₂ equivalent. Changes in CH ₄ and N ₂ O as a result of the shift in fuel from coal to biomass are taken into account.
Indicator 2 - Contribution to local environmental sustainability	3	The improvement in local air quality by reducing SO ₂ and N ₂ O emissions from coal as the consumption of coal is reduced by replacement by biomass. In the Richards Bay area there will be a reduction in methane emissions from landfill due to a reduction in the amount of biomass landfilled.
Indicator 3 - Contribution to net employment generation	1	There will be a minimal increase in employment due to construction and commissioning the systems, as well in the supply of the additional transport needs. This will occur specifically in the small to medium sized Enterprises (SMME).
Indicator 4 - Contribution to the sustainability of the balance of payments	1	For both project activities, local technology will be used.
Indicator 5 - Contribution to macroeconomic sustainability	1	There will be no impact on national imports or exports. Minor impact expected on regional import of coal to the KZN area as the amount of coal reduction compared to the total amount of coal transported by rail from other regions is small. The project activity will also result in more efficient production processes at Mondi.
Indicator 6 - Cost Effectiveness	2	The project is only cost-effective if the carbon financing is included. In such a case the internal rate of return makes the project cost effective for the project participant to finance.
Indicator 7 - Contribution to technological self-reliance	0	Technological self-reliance stays similar to the baseline case. Some additional electricity has to be imported from the national grid but is offset by the reduced amount of coal that has to be imported from other regions by rail. Biomass is accessible locally.
Indicator 8 - Contribution to the sustainable use of natural resources	2	Energy efficiency improvement and the use of renewable energy reduce the use of natural resources.

The matrix above has been developed by Helio International and adapted by the **SouthSouthNorth** project team to appraise projects against sustainable development indicators. The indicators are qualitatively rated –3 to 3 for least to most contribution to the indicator. As a threshold or ceiling indicators 2 and 3 must provide positive contributions to distinguish the

² The SouthSouthNorth Sustainable Development Appraisal & Ranking Matrix Tool, the SouthSouthNorth Project, 2003.

project from business-as-usual in the South African context. For further explanation of the SD matrix tool visit www.southsouthnorth.org

The project scores 14 out of a possible maximum of 24, which indicates that the project activity will have a positive impact towards Sustainable Development rather than a negative one. The self-imposed sustainable development eligibility threshold that includes positive scores for indicators 2 and 3 is met.

A.4 Technical description of the project activity

The biomass boiler at the Richards Bay Mill is currently operated under its designed capacity in terms of biomass utilisation. The project aims to extend the operation of this boiler to utilise an additional quantity of biomass as fuel. Only modifications to the existing boiler technology to accommodate more biomass are envisaged. New technology will be introduced in the wood yard where equipment will be introduced to remove contaminants from the discarded chips. The project results in an increase of road based transport for biomass and a decrease for ash and rail based coal transportation.

A.4.1 Location of the project activity:**A.4.1.1** The host country is South Africa**A.4.1.2** KwaZulu Natal Province**A.4.1.3** Richards Bay**A.4.1.4 Detailed description of the physical location, including information allowing the unique identification of this project activity**

The Richards Bay Mill is located in Richards Bay, a harbour and industrial town that has developed since the early 1980's and is situated approximately 180 km north of Durban. The Mill site has a spacious layout with ample space for large-scale expansions. It has good road and rail connections, and is located only a few kilometres from the Richards Bay harbour. The Richards Bay Pulp and Linerboard Mill were commissioned during October 1984.

A.4.2 Type, categories and technology of project activities

The suggested project is comprised of a bundle across two project activities utilising different technological typologies ³with two distinct project boundaries.

These are:

1. Project Activity 1: Type III Other Project Activities: Category III E: Methane avoidance

Biomass, currently being landfilled, and that left to decay in plantations, will be transported to the Richards Bay mill to be burnt (in a boiler) for energy purposes. Production of methane from biomass and other organic matter will be avoided because of the project activity.

2. Project Activity 2: Type I Renewable Energy: Category I C: Thermal energy for the user

Recovered biomass from the landfill and plantation residues collected and transported to the paper mill will replace coal as energy source in one power boiler that provides thermal energy to the operations. The biomass will be collected, transported to the mill, separated, cleaned, shredded and conveyed to the biomass boiler. The technology to be implemented will include new equipment to separate, shred, clean and convey the biomass to the boiler. Greenhouse gas emissions from burning coal will be reduced.

A.4.3 Brief statement to describe in what way anthropogenic emissions of greenhouse gasses (GHGs) by sources are to be reduced by the proposed CDM project activity:

Project Activity 1 will result in the avoidance of methane emissions formation associated with landfill and plantations. Project activity 2 will result in the reduction of GHG emissions due to the replacement of coal by biomass as an energy resource in the boiler. GHG emissions from transport of coal by train to the mill and coal ash by road from the mill to landfill will be reduced proportionally to the reduction in coal use. To handle additional incoming biomass new equipment will be installed in the wood yard to shred and sort biomass waste received from nearby industries and farmers. The new equipment will require additional electricity from the grid and hence result in GHG emissions.

³ The small-scale project activity typologies can be found as Appendix B to the Small-Scale CDM simplified modalities and procedures found on www.unfccc.int/cdm.

A.4.4 Public funding of the project activity

No public funding is involved in the proposed project.

A.4.5 Confirmation that the small-scale project activity is not a debundled component of a larger project activity:

The project size is within the limits described in the modalities and procedures of small-scale CDM project activities and not a portion of a larger project. Mondi can confirm that the proposed project activity is not a debundled component of a larger project activity.

B. BASELINE METHODOLOGY

B.1 Title and reference for the project category applicable to the project activity:

The bundled project activity will consist of **two** identifiable project activities:

Project Activity 1: Methane avoidance (Type III Other Project Activities: Category III E: Methane avoidance)

The fines and woodchips contaminated with rocks, sand and metal are currently being landfilled in a Richards Bay landfill site where they ferment over time, emitting methane. Plantation waste currently left in plantations to decay will also be collected. Both sources of biomass will be transported to the boiler, where it will be used to generate heat and power, instead of being landfilled. Methane emissions will be avoided due to this project activity. As the landfill gas does not currently have to be managed, all of the methane that would have been produced by the wood chips is therefore included in the baseline. Changes in the licensing requirements will be monitored and the implications of LFG management included in the baseline at the time this would have been introduced.

Project Activity 2: Thermal energy for the user (Type I Renewable Energy: Category I C: Thermal energy for the user)

The plantation residues and the fines and woodchips contaminated with rocks, sand and metal will be cleaned and shredded. Together the 2 streams of biomass will replace coal for the generation of heat and power for the manufacturing process. The project activity excludes the average 235 to 300 tonnes per day biomass (average for 2003 and running average for 2004) currently being fed into the boiler (Reference: P Kotze pers. comms. 2004).

B.2 Project category applicable to the project activity

Both project activities fall within the small-scale size limits and therefore qualify for simplified procedures.

Project Activity 1: Type III Other Project Activities: Category III E: Methane avoidance

The project category comprises measures that avoid the production of methane from biomass that would have otherwise been left to decay as a result of anthropogenic activity (landfilling or left to decay in plantations).

Biomass is a renewable resource, thus its treatment (burning) in the project activity results in zero CO₂ emissions. However, the amount of N₂O and CH₄ emissions that are generated in the treatment (burning) of the fines and cleaned woodchips is less than 15 kilotonnes per annum.

Project Activity 2: Type I Renewable Energy: Category I C: Thermal energy for the user

The category includes biomass-based co-generation systems that produce heat and electricity for use on site.

Project activity 2 results in the production of 13.2MW equivalent of thermal power in the biomass boiler. This is below the 15 MW for renewable energy and/or less than 45MWe for cogeneration projects. The rated capacity of the boiler is 65MWe for co-firing coal and bark, however the validated limit of the quantity of biomass that the boiler can take is 25.98 tonnes per hour (623 tonnes per day).

When calculating the boiler output including the calorific value of the biomass, the efficiency of the boiler and the combustion of the biomass, the boiler is rated at 44MWe. The steam produced by the boiler is used for the generation of electricity and the provision of process heat for the pulp and paper mill.

$$\Rightarrow (25.98) * (8) * (0.8371) * (0.91) / 3.6 = 43.98 \text{ MW of steam}$$

(This is in (25.98 tonnes/hour biomass) * (8 MJ/kg) * (0.8371 combustion efficiency) * (0.91 heat transfer efficiency) / (3600 secs/hr)/1000kgs/tonne)

The heat transfer efficiency is 91% that gives an overall boiler efficiency of 76%. Independent consultants (ESP Consultants cc) have verified these figures and these reports should be available at Power & Recovery Department of the Mondi Richards Bay Mill.

B.3 Description of how the anthropogenic GHG emissions by sources are reduced below those that would have occurred in the absence of the registered CDM project activity (*i.e. explanation of how and why this project is additional and therefore not the baseline scenario*)

A number of options were considered:

1. Existing Power Boiler will be fuelled with mainly coal on a continuous basis. The biomass that cannot be burnt in the boiler will be landfilled by Mondi Richards Bay in the Mondi owned landfill site. Biomass from other entities will continue to be landfilled in the regional landfill site. (Status Quo)
2. Export of the biomass is not feasible without pelletisation as the quality of the bark is not good enough for export purposes – it is contaminated with sand, metal etc. The investigation regarding pelletisation possibilities has been done and currently the quality of this particular biomass being considered is substandard and not suitable for pelletisation. The internal policy of the Richards Bay mill is to utilise all biomass possible for paper and pulp production.

Both alternatives will comply with all South African regulations. The proposed project activity is not the only alternative amongst the ones considered by Mondi that is in compliance with all regulations.

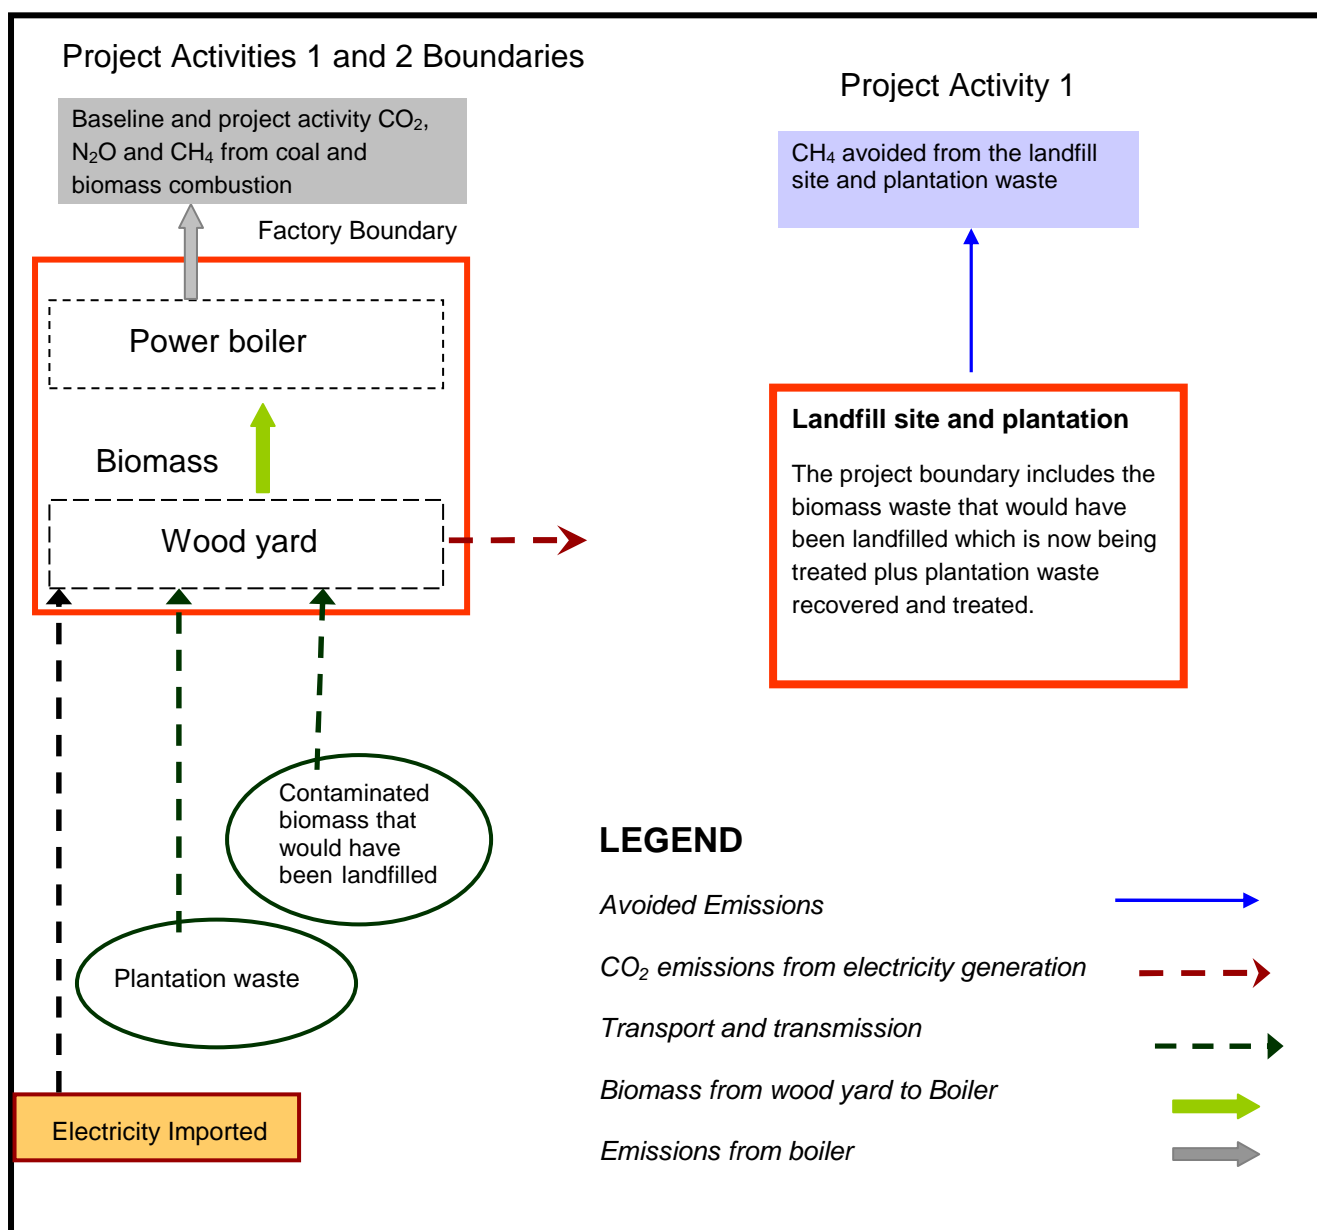

Mondi Business Paper South Africa has specific requirements in terms of return on investment of a proposed project in order to approve the project. Any small scale to medium scale project has to meet a minimum of between 17-20% IRR for approval, if the project is a stand alone one (Mondi Executive Board guidelines).

The project activity does not meet this IRR requirement without income from the CDM component.

Based on financial calculations the annual cash flow without income from the sale of credits, produces a pre-tax internal rate of return of below 10% per annum (after-tax this is negative) well below the Mondi requirement for the project to go ahead. An inflation rate of 5.5% was used in these calculations.

B.4 Description of the project boundary for the project activity

The project activities, which make up this project, have to have separate and distinct boundaries:

Project Activity 1: The project boundary is defined as “the physical, geographical site where the treatment takes place”. The project boundary is, therefore, set in this case by the biomass waste that would have been landfilled plus plantation waste that would have decayed there, that is now recovered and treated in the 2nd project activity. The boundary for project activity 1 is therefore the same boundary as the boundary defined for project activity 2.

Project Activity 2: The project boundary is defined as “The physical, geographical site of the renewable energy technologies generating the thermal energy that delineates the project boundary.” (Ref: Annex 2 to the minutes from the 12th meeting of the Methodology Panel of the Executive Board of the CDM.

The boundary, therefore, includes the biomass boiler at Mondi in Richards Bay and all new or retrofitted equipment in the wood yard implemented to handle the additional biomass fuel.

B.5 Details of the baseline and its development

B.5.1 For Type III E biomass waste would have been landfilled at a municipal landfill site to decay resulting in methane emissions. Methane emissions from landfill would not have been recovered and would have percolated into the atmosphere. The landfill is managed and is deeper than 5 metres. There are currently no requirements by the landfill licensing authority (South African Government Department of Water Affairs and Forestry) to manage the landfill gas, but in 6 years time monitoring may be initiated leading to the possibility of landfill gas extraction according to licensing agreements (Clive Oosterhuizen, Richards Bay landfill manager Pers comm. 5 October 2004). For this purpose, landfill gas licensing arrangements will be monitored and their impact on the baseline calculated from the date that compliance is required.

Plantation waste would have decayed in the plantation, releasing methane emissions over time.

For Type IC coal would have been used to provide thermal energy to the paper manufacturing process. GHG emissions result from the burning of fossil fuel (coal) in the coal fired power boiler. In the project activity an extra average amount of 250 tonnes of biomass per day is expected to be burnt, roughly equivalent to 71.4 tonnes of coal per day. Currently, biomass is burnt in the boiler and this will continue in future. This amounts to 235 tonnes per day (2003 average) to 300 tonnes per day 2004 running average, but being biogenic and renewable there are no CO₂ emissions attributed to its burning. N₂O and CH₄ emissions from the burning of biomass in the boiler are taken into account in the baseline calculations.

B.5.2 Date of completing the final draft of this baseline section:

March 2005

B.5.3 The baseline is determined by a Project Design Team comprising the following persons/entities:

Ms Ciska Terblanche, Mondi Business Paper, Richards Bay (project participant)

Mr Steve Thorne, SouthSouthNorth (not a project participant)

C. DURATION OF THE PROJECT ACTIVITY / CREDITING PERIOD**C.1 Duration of the project activity:****C.1.1 Starting date of the project activity**

May 2005

C.1.2 Expected operational lifetime of the project activity:

The operational lifetime of the technology is in excess of 10 years but the crediting period will be limited to a maximum of 10 years.

C.2 Choice of the crediting period and related information: (Please underline the selected option (C.2.1 or C.2.2.) and provide the necessary information for that option)

C.2.1 Renewable crediting period (at most seven (7) years per period)

Not selected

C.2.2 Fixed crediting period (at most ten (10) years):**C.2.2.1 Starting date**

May 2005

C.2.2.2 Length (max 10 years):

10y-0m

D. Monitoring methodology and plan

(The monitoring plan shall incorporate a monitoring methodology specified for the applicable project category for CDM small-scale project activities contained in Annex B of the simplified M&P for CDM small-scale project activities and represent good monitoring practice appropriate to the type of project activity.

The monitoring plan shall also provide information on the collection and archiving of the data specified in Annex B of the simplified M&P for CDM small-scale project activities to:

- Estimate or measure emissions occurring within the project boundary;*
- Determine the baseline;*
- Estimate leakage, where this needs to be considered.*

Project participants shall implement the registered monitoring plan and provide data, in accordance with the plan, through their monitoring reports.

Operational entities will verify that the monitoring methodology and plan have been implemented correctly and check the information in accordance with the provisions on verification. This section shall provide a detailed description of the monitoring plan, including an identification of the data to be collected, its quality with regard to accuracy, comparability, completeness and validity, taking into consideration any guidance contained in the methodology, and archiving of the data collected.

Please note that monitoring data required for verification and issuance are to be kept for two years after the end of the crediting period or the last issuance of CERs for this project activity, whichever occurs later.

An overall monitoring plan that monitors performance of the constituent project activities on a sample basis may be proposed for bundled project activities. If bundled project activities are registered with an overall monitoring plan, this monitoring plan shall be implemented and each verification/certification of the emission reductions achieved shall cover all of the bundled project activities.)

D.1 Name and reference of approved methodology applied to the project activity

(Please refer to the UNFCCC CDM web site for the most recent version of the indicative list of CDM small-scale project activities contained in Annex B of the simplified M&P for CDM small-scale project activities.)

(If a national or international monitoring standard has to be applied to monitor certain aspects of the project activity, please identify this standard and provide a reference to the source where a detailed description of the standard can be found.)

D.2 Justification of the choice of the methodology and why it is applicable to the project activity

(Justify the choice of the monitoring methodology applicable to the project category as provided for in Annex B.)

The methodology addresses all the necessary parameters to estimate emissions from the two project activities. The frequency of verification of the monitored parameters will be left to the project participant to decide based on verification costs and cash flow requirements. Both Type IC and Type IIIE monitoring protocols have been specified as outlined in Appendix B to the small-scale M&P.

D.3 Data to be monitored

The table below specifies the minimum information to be provided for monitored data. Please complete the table for the monitoring methodology chosen for the proposed project activity from the simplified monitoring methodologies for the applicable CDM small-scale project activity category contained in Annex B of the simplified M&P for CDM small-scale project activities.

Please note that for some project categories it may be necessary to monitor the implementation of the project activity and/or activity levels for the calculation of emission reductions achieved.

E. CALCULATION OF GHG EMISSION REDUCTIONS BY SOURCES

Uncertainties

Calculations done for this project are ex-ante calculations based on conservative projections on the availability of biomass, and hence the replacement of coal as a fuel. During the monitoring of parameters, the ex-ante estimates of emissions will be corrected ex-post as applicable.

E.1 Formulae used

In E.1.1 please provide the formula used to calculate the GHG emission reductions by sources in accordance with the applicable project category of CDM small-scale project activities contained in Annex B of the simplified M&P for CDM small-scale project activities.

In case the applicable project category from Annex B does not specify a specific formula to calculate the GHG emission reductions by sources please complete E.1.2 below.

E.1.1 Selected formulae as provided in Annex B

Type IIIE (Methane Avoidance) and Type IC (Renewable Energy- Thermal Energy of the user) formulae for the estimation of emissions for baseline activity emissions and project activity emissions have been provided by Appendix B of the Small-Scale Modalities and procedures.

Assumptions used in calculations:

- It is estimated that an approximate additional maximum of 250 tonnes of biomass per day will be treated in the boiler. The biomass can be a mixture of fines and woodchips contaminated with rocks, sand and metal, and plantation residues.
- The biomass that would have been landfilled (avoided) is assumed to be at least 25% of the biomass burnt in the boiler from year 4 onwards. From year 1 onwards, the full amount of contaminated biomass that would have been landfilled, will be burnt in the boiler. The amount of biomass not being landfilled will be monitored.

Table 5: *Figures used in calculations for Project Activity 1: Avoided methane emissions from landfill and plantation waste*

Global warming potential (GWP) of methane	21 (IPCC, 2001)
Landfill Methane correction factor (MCF)	Default is 1 for a managed landfill waste site deeper than 5 metres (IPCC, 2004)
Landfill Degradable organic carbon (DOC)	0.3 Default value (IPCC, 2004)
Fraction DOC dissimilate to landfill gas (DOC _f)	0.77 Default value (IPCC, 2004)
Fraction of CH ₄ in landfill gas (F)	0.5 Default value (IPCC, 2004)
Plantation Methane correction factor (MCF)	0.4 Default (IPCC, 2004)
Plantation Degradable organic carbon (DOC)	0.3 Default value (IPCC, 2004)

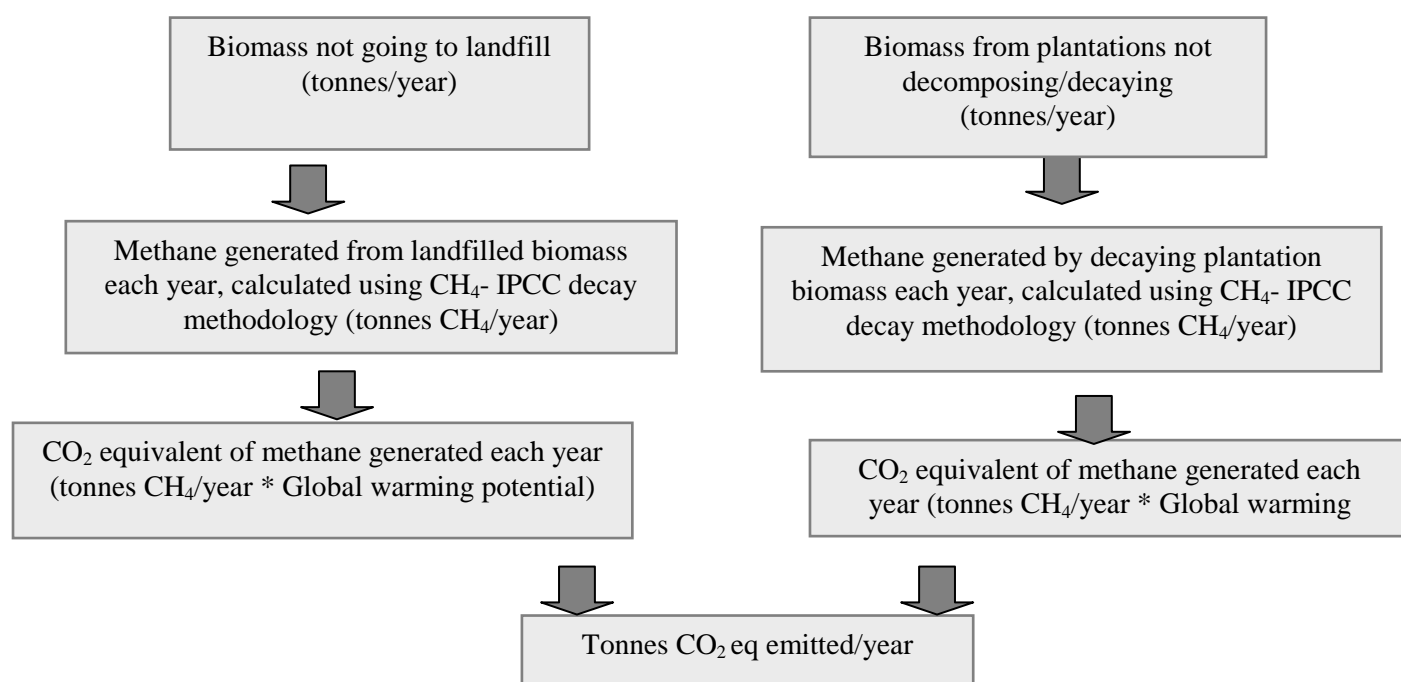

Table 6: *Figures used in calculations for Project Activity 2: Reduction in coal consumption*

Calorific Value (CV) - Bituminous coal	27.5 MJ/kg
Calorific Value - Biomass	8 MJ/kg
Combustion efficiency of biomass (CE _B)	83.7%
Combustion efficiency of coal (CE _C)	85.3%
Thermal efficiency of boilers (TE)	91%
Plant operation	350 days/year
IPCC CO ₂ emission factor for bituminous coal	2465 kg CO ₂ /tonne coal (IPCC, 2001)
CH ₄ emission factor for biomass and waste combustion	300 kg of CH ₄ /TJ Default value (IPCC, 2004) (0.012 kg/GJ fuel)
N ₂ O emission factor for biomass and waste combustion	0.004 kg/GJ fuel
CH ₄ emission factor for coal combustion	0.0016 kg/GJ fuel
N ₂ O emission factor for coal combustion	0.001 kg/GJ fuel
Weighted average CO ₂ emissions for Electricity imported from national grid	0.89kg CO ₂ /kWh (Eskom)
Global warming potential (GWP) of N ₂ O	310 tonne CO ₂ /tonne N ₂ O
Global warming potential (GWP) of (CH ₄)	21 tonne CO ₂ /tonne CH ₄

Algorithm for calculating emissions from Project Activity 1 (Methane Avoidance)

The following schematic algorithm describes the calculation steps for estimating the emissions reductions that are attributable to project activity 1. The calculation steps do not consider the increment between the baseline and project activity.

Calculation methodology for avoided methane release from landfilled biomass and plantation biomass. The calculation used is referred to in Appendix B of the simplified modalities and procedures for small-scale CDM project activities.

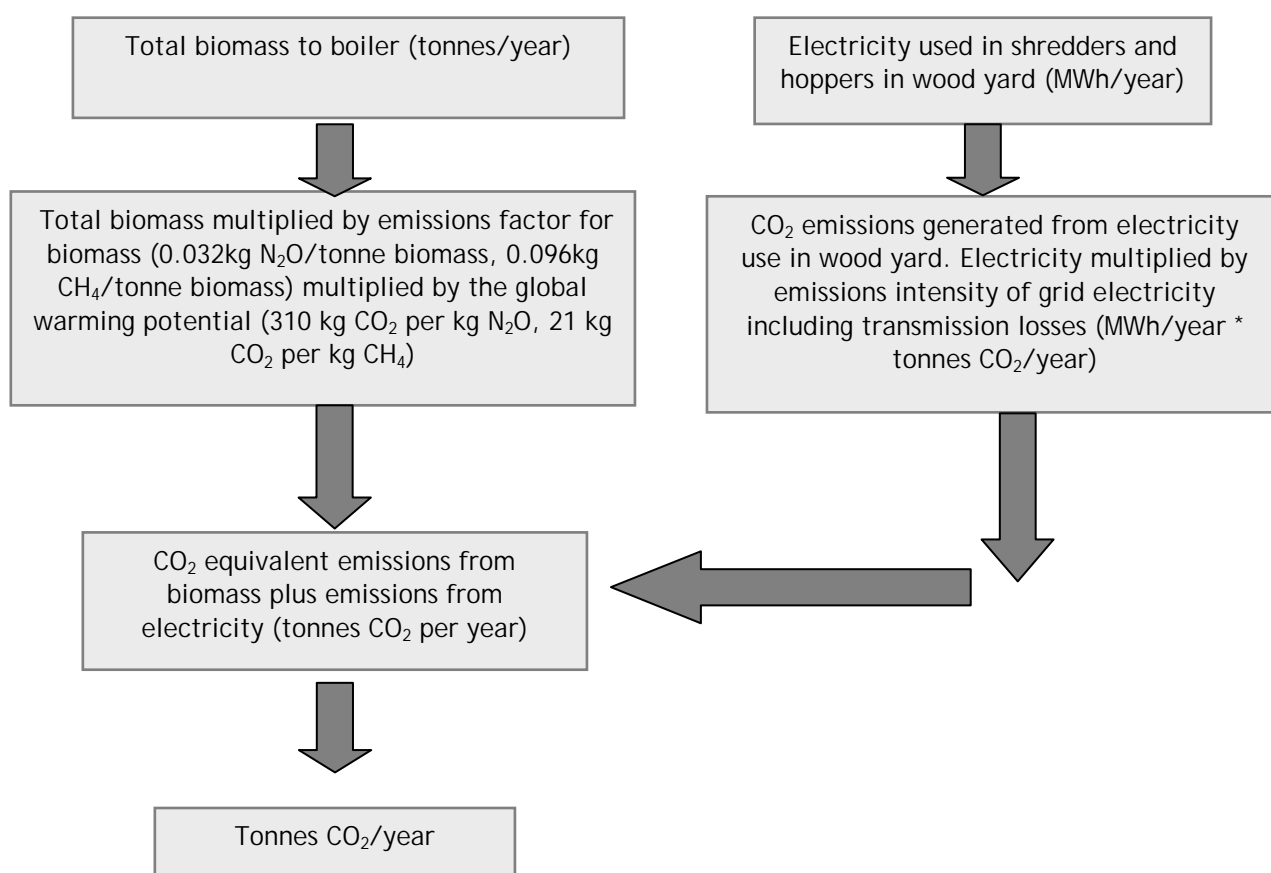

Notes:

- Biomass in project activity 1 will be burnt ("treated") in the 2nd project activity i.e. overlapping project boundaries.
- The CH₄ and N₂O emissions from the treatment of the biomass are less than 15 kilotonnes of CO₂ equivalent.

Algorithm for calculating emissions Project Activity 2 (Thermal energy of the user)

The following algorithm describes the calculation steps for estimating the emission reductions that are attributable to the baseline and project activity 2. The calculation steps consider the increment between the baseline and project activity.

The amount of coal being fired in the coal/bark boilers was 130 (in 2003) and 121 (in 2004 so far) tonnes coal per day. “If we fire 500+ t/d biomass there will not be enough combustion air capacity to fire coal as well” Piet Kotze pers comm. October 15 2004.

Notes:

- In project activity 2, biomass waste that would have gone to landfill plus plantation waste will be burnt to provide heat and power.
- CO₂ emissions from electricity use in the wood yard will be accounted for in the project activity emissions.
- The project activity includes baseline biomass of 235 tonnes (2003 average), to 300 tonnes (2004 average) being burnt per day.
- N₂O and CH₄ emissions in both the baseline and the project activity are excluded for the 235 to 300 tonnes biomass per day.

Formulae for calculating emissions from Project Activity 2

In this project activity, biomass will be exclusively burnt in the boiler under normal operational conditions. Below are the equations for calculating GHG emissions from the burning of biomass.

(Equation 1) CO₂ emissions from biomass

$$CO_2 \text{ emissions}_B \left(\frac{\text{tonne}}{\text{year}} \right) = \text{Biomass burnt} \left(\frac{\text{tonne}}{\text{year}} \right) \times IPCC \text{ EF} \left(\frac{\text{tonne } CO_2}{\text{tonne biomass}} \right)$$

(Equation 2) CO₂ equivalent of N₂O emissions from biomass

$$CO_2 \text{ eq of } N_2O \text{ emissions}_B \left(\frac{\text{tonne}}{\text{year}} \right) = \text{Biomass burnt} \left(\frac{\text{tonne}}{\text{year}} \right) \times IPCC \text{ EF} \left(\frac{\text{tonne } N_2O}{\text{tonne biomass}} \right) \times GWP \text{ for } N_2O$$

(Equation 3) CO₂ equivalent of CH₄ emissions from biomass

$$CO_2 \text{ eq of } CH_4 \text{ emissions}_B \left(\frac{\text{tonne}}{\text{year}} \right) = \text{Biomass burnt} \left(\frac{\text{tonne}}{\text{year}} \right) \times IPCC \text{ EF} \left(\frac{\text{tonne } CH_4}{\text{tonne biomass}} \right) \times GWP \text{ for } CH_4$$

(Equation 4) CO₂ emissions from electricity

$$CO_2 \text{ emissions}_E \left(\frac{\text{tonne}}{\text{year}} \right) = \text{Electricity consumption} (MWh) \times SA \text{ grid EF} \left(\frac{\text{tonne } CO_2}{MWh} \right)$$

(Equation 5) Total CO₂ equivalent emissions from biomass per tonne

$$\text{Tonnes } CO_2 \text{ eq emissions per year} = CO_2 \text{ eq emissions}_B \left(\frac{\text{tonne}}{\text{year}} \right) + CO_2 \text{ emissions}_E \left(\frac{\text{tonne}}{\text{year}} \right)$$

(Equation 6) Tonne N₂O emissions per tonne biomass

$$\frac{\text{Tonne } N_2O}{\text{tonne biomass}} = N_2O \text{ EF}_B \left(\frac{\text{kilogramme}}{GJ} \right) \times CV_B \left(\frac{GJ}{\text{kilogramme}} \right) \times \frac{\text{tonne}}{\text{kilogramme}}$$

(Equation 7) Tonne CH₄ emissions per tonne biomass

$$\frac{\text{Tonne } CH_4}{\text{tonne biomass}} = CH_4 \text{ EF}_B \left(\frac{\text{kilogramme}}{GJ} \right) \times CV_B \left(\frac{GJ}{\text{kilogramme}} \right) \times \frac{\text{tonne}}{\text{kilogramme}}$$

Calculation example for emissions from Project Activity 2:

There may be occasions when coal is used for example during start-up conditions. This will be monitored and these emissions will be added to the project activity emissions. For the purpose of this calculation, incidental use of coal is not included.

From equation 6:

$$\frac{\text{Tonne } N_2O}{\text{tonne biomass}} = 0.004 \left(\frac{\text{kilogramme}}{\text{GJ}} \right) \times 0.008 \left(\frac{\text{GJ}}{\text{kilogramme}} \right)$$

$$0.000032 = \left(\frac{\text{tonne } N_2O}{\text{tonne biomass}} \right) \dots\dots 6a$$

From equation 7:

$$\frac{\text{Tonne } CH_4}{\text{tonne biomass}} = 0.012 \left(\frac{\text{kilogramme}}{\text{GJ}} \right) + 0.008 \left(\frac{\text{GJ}}{\text{kilogramme}} \right) \dots\dots$$

$$= 0.0000275 \left(\frac{\text{Tonne } CH_4}{\text{tonne biomass}} \right) \dots\dots 7a$$

From equation 1 for year 4:

It is estimated that by year 4 an additional 250 tonnes of biomass per day will be burnt in the boiler. That amounts to a total of 87500 tonnes of biomass for year 4.

$$\begin{aligned}
 CO_2 \text{ emissions}_B \left(\frac{\text{tonne}}{\text{year}} \right) &= \text{Biomass burnt} \left(\frac{\text{tonne}}{\text{year}} \right) \times IPCC EF_B \left(\frac{\text{tonne } CO_2}{\text{tonne biomass}} \right) \\
 &= 87500 \left(\frac{\text{tonne biomass}}{\text{year}} \right) \times 0 \left(\frac{\text{tonne } CO_2}{\text{tonne biomass}} \right) \\
 &= 0 \left(\frac{\text{tonne } CO_2}{\text{year}} \right) \dots\dots 1a
 \end{aligned}$$

From equation 2:

$$\begin{aligned}
 CO_2 \text{ eq of } N_2O_B \left(\frac{\text{tonne}}{\text{year}} \right) &= \frac{\text{Biomass}}{\text{burnt}} \left(\frac{\text{tonne}}{\text{year}} \right) \times IPCC EF_B \left(\frac{\text{tonne } N_2O}{\text{tonne biomass}} \right) \times GWP \text{ for } N_2O \\
 &= 87500 \left(\frac{\text{tonne biomass}}{\text{year}} \right) \times 0.000032 \left(\frac{\text{tonne } N_2O}{\text{tonne biomass}} \right) \times 310 \text{ (GWP for } N_2O) \\
 &= 868 \left(\frac{\text{tonne } CO_2}{\text{year}} \right) \dots\dots 2a
 \end{aligned}$$

From equation 3:

$$\begin{aligned}
 CO_2 \text{ eq of } CH_4_B \left(\frac{\text{tonne}}{\text{year}} \right) &= \text{Biomass burnt} \left(\frac{\text{tonne}}{\text{year}} \right) \times IPCC EF_B \left(\frac{\text{tonne } CH_4}{\text{tonne biomass}} \right) \times GWP \text{ for } CH_4 \\
 &= 87500 \left(\frac{\text{tonne biomass}}{\text{year}} \right) \times 0.000096 \left(\frac{\text{tonne } CH_4}{\text{tonne biomass}} \right) \times 21 \\
 &= 176 \left(\frac{\text{tonne } CO_2}{\text{year}} \right) \dots\dots 3a
 \end{aligned}$$

From equation 4:

$$\begin{aligned}
 CO_2 \text{ emissions}_E \left(\frac{\text{tonne}}{\text{year}} \right) &= \text{Electricity consumption (MWh)} \times \text{SA grid EF} \left(\frac{\text{tonne } CO_2}{\text{MWh}} \right) \\
 &= 627 \left(\frac{\text{MWh}}{\text{year}} \right) \times 0.89 \left(\frac{\text{tonne } CO_2}{\text{MWh}} \right) \\
 &= 558 \left(\frac{\text{tonne } CO_2}{\text{year}} \right) \text{ T\&D losses 10\%)} \\
 &= 614 \left(\frac{\text{tonne } CO_2}{\text{year}} \right) \dots\dots\dots 4a
 \end{aligned}$$

Table 7: Summary of Project Activity 1 and Project Activity 2 emissions

Project Activities				
Emission Source	Quantity	Energy equivalent	Emissions intensity	CO ₂ emissions
				Kilo tonnes
Project Activity 1				
biomass to landfill year 1	0	0	0	0
biomass to landfill year 2	0	0	0	0
biomass to landfill year 3	0	0	0	0
biomass to landfill years 4 to 10	0	0	0	0
Subtotal				0
Project Activity 2				
Biomass to boiler year 1	35 000 tonnes/year	280 000 GJ/year	N ₂ O CH ₄	347+ 71
Biomass to boiler year 2	52 500 tonnes/year	420 000 GJ/year	N ₂ O CH ₄	521+ 106
Biomass to boiler Year 3	70 000 tonnes/year	560 000 GJ/year	N ₂ O CH ₄	694+ 141
Biomass to boiler Years 4 to 10	87 500 tonnes/year	700 000 GJ/year	N ₂ O CH ₄	868+ 176
Coal ²	0 t/a	0	0	0
Electricity consumption	MWh/year	627 MWh/year	0.89 tonnes CO ₂ /MWh /0.9* 10 years	620
Subtotal				153.9 kilo tonnes

E.1.2.2 Leakage – not applicable to either project type because of small-scale methodologies, however, leakage from transport is calculated and included in Annex 3. Negative leakage will be ignored on the grounds of conservatism.

E.1.2.3 The sum of E.1.2.1 and E.1.2.2 represents the Project Activity emissions

Table 8: *Summary of Project Activity emissions*

<i>Source</i>	<i>CO₂ emissions Kilo tonnes</i>
Project Activity 1	0
Project Activity 2	153.9
Leakage	n/a
Total project activities and leakage CO₂ emissions	153.9

E.1.2.4 Describe the formulae used to estimate the anthropogenic emissions by sources of greenhouse gases in the **baseline** using the baseline methodology for the applicable project category in Annex B to the simplified modalities and procedures for small-scale CDM project activities: *(for each gas, source, formulae/algorithm, emissions in units of CO₂ equivalent)*

Formulae for calculating emissions from Project Activity 1 Baseline: Methane Avoidance

Baseline emissions are the amount of methane from the decay of the biomass treated in the project activity (in this case treated in the 2nd project activity). This biomass includes biomass that goes to landfill and plantation biomass.

Equation 8

$$CH_4 \text{ IPCC decay} = MCF \times DOC \times DOC_f \times F \times \frac{16}{12}$$

For the calculation of CH₄ IPCC decay the IPCC default values have been used

Where;

- **CH₄ IPCC decay** refers to the emission factor for decaying biomass in the region of the project activity (tonnes of CH₄ /tonne of biomass or organic waste);
- **MCF** refers to the methane correction factor (fraction)(default is 1 as the landfill site is managed and 10 metres deep); For plantation waste the MCF default is 0.4 (for unmanaged shallow waste sites under 5 meters)
- **DOC** refers to the degradable organic carbon 0.4 ((percent waste that is paper and textiles) + 0.17 (per cent waste that is garden waste, park waste or other non-food organic petruscibles + 0.15 (per cent waste that is food waste) + 0.30 per cent waste that is wood or straw; For plantation waste the DOC is 0.3 for 100% wood
- **DOC_F** refers to the fraction DOC dissimilate to landfill gas (IPCC default value is 0.77); and
- **F** refers to the fraction of CH₄ in landfill gas (IPCC default value is 0.5)

Therefore, the baseline methane emissions from biomass decay (tonnes of CO₂ equivalent) is equal to the quantity of biomass treated under the project activity (in this case treated in project activity 2) x CH₄ IPCC decay x CH₄ GWP (tonnes of CO₂ equivalent / tonne CH₄)

Equation 9: CO₂ equivalent from biomass

$$CO_2 \text{ eq of } CH_4 \text{ formation from biomass decay for landfill} = \frac{\text{Amount of Biomass burnt in project activity previously landfilled}}{\text{Amount of Biomass burnt in project activity previously landfilled}} \times CH_4 \text{ IPCC decay (landfill)} \times GWP \text{ for } CH_4$$

Equation 10

$$CO_2 \text{ eq of } CH_4 \text{ from plantation waste decay} = \frac{\text{Amount of Biomass burnt in project activity previously left t in plantations}}{\text{Amount of Biomass burnt in project activity previously left t in plantations}} \times CH_4 \text{ IPCC decay (plantation)} \times GWP \text{ for } CH_4$$

Equation 11

$$\text{Total } CO_2 \text{ eq of } CH_4 \text{ formation from biomass decay} = \frac{CO_2 \text{ eq of } CH_4 \text{ formation from plantation waste}}{\text{formation from plantation waste}} + \frac{CO_2 \text{ eq of } CH_4 \text{ formation from biomass decay in landfill}}{\text{formation from biomass decay in landfill}}$$

Calculation example for baseline emissions from Project Activity 1:

For landfill from equation 8:

$$\begin{aligned} CH_4 \text{ IPCC decay} &= 1 (MCF) \times 0.3 (DOC) \times 0.77 (DOC \text{ dissimilated to landfill gas}) \times 0.5 \left(\frac{CH_4 \text{ fraction in landfill gas}}{CH_4 \text{ fraction in landfill gas}} \right) \times \frac{16}{12} \\ &= 0.154 \left(\frac{\text{tonne } CH_4}{\text{year}} \right) \dots 8a \end{aligned}$$

Therefore baseline methane emissions (in year 1) from equation 9:

$$\begin{aligned} \text{CO}_2 \text{ eq of Methane formation} &= 21875 \left(\frac{\text{tonnes}}{\text{year}} \right) \times 0.154 \times 21 \\ \text{from biomass decay for landfill} & \\ &= 70.7 \left(\frac{\text{kilotonne CO}_2}{\text{year}} \right) \dots 9a \end{aligned}$$

For plantation waste decay from equation 8:

$$\begin{aligned} \text{CH}_4 \text{ IPCC} &= 0.4 (\text{MCF}) \times 0.3 (\text{DOC}) \times 0.77 (\text{DOC dissimilated}) \times 0.5 \left(\frac{\text{CH}_4 \text{ fraction}}{\text{in landfill gas}} \right) \times \frac{16}{12} \\ \text{decay} & \\ &= 0.0616 \left(\frac{\text{tonne CH}_4}{\text{year}} \right) \dots 8b \end{aligned}$$

Therefore baseline methane emissions from plantation waste (in year 1) from equation 10:

$$\begin{aligned} \text{CO}_2 \text{ eq of Methane formation} &= 13125 \left(\frac{\text{tonnes}}{\text{year}} \right) \times 0.0616 \times 21 \\ \text{from biomass decay for plantations} & \\ &= 16.9 \left(\frac{\text{kilotonne CO}_2}{\text{year}} \right) \dots 10a \end{aligned}$$

From equation 11:

$$\begin{aligned} \text{Total CO}_2 \text{ eq of Methane formation} &\left(\frac{\text{kilotonnes}}{\text{year}} \right) = 28.29 \left(\frac{\text{kilo tonnes}}{(\text{from landfill}) \text{ year}} \right) + 16.9 \left(\frac{\text{kilo tonnes CO}_2}{(\text{from plantation}) \text{ year}} \right) \\ &= 45.2 \left(\frac{\text{kilo tonnes}}{\text{year}} \right) \dots 11a \end{aligned}$$

Table 9: Summary of Project activity 1 Baseline emissions

Project Activity 1 Baseline				
<i>Emission Source</i>	<i>Quantity of biomass not going to landfill or plantations</i>	CH ₄ IPCC decay (IPCC default values have been used)	<i>Emissions intensity</i>	<i>Baseline CO₂ equivalent emissions</i>
	tonnes _{biomass} /annum	tonnes CH ₄ /year	tonnes CO ₂ /tonne	Kilo tonnes
Avoided methane from landfill years 1 to 10	21875	3369	21 tonnes CO ₂ equivalent /tonne CH ₄ /year	70.74
Avoided methane from plantations years 1 to 10	13125	808	21 tonnes CO ₂ equivalent /tonne CH ₄ /year	*0
Electricity consumption	MWh/a	0	0.89 tonnes CO ₂ /MWh*/0.9 *10 years	0
Subtotal				707.4

Reference: Comment regarding plantation waste in text box on page 3

Therefore total avoided emissions from this project activity for a 10year crediting period are 707 kilotonnes of CO₂ equivalent•

Formulae for calculating emissions from Project Activity 2 Baseline: Thermal energy of the user

Notation:

Combustion Efficiency = CE

Thermal Efficiency = TE

Emissions Factor = EF

Equation 12

$$Coal\ burnt \left(\frac{tonne}{day} \right) = Biomass \left(\frac{tonne}{day} \right) * \frac{CV_{biomass} \left(\frac{MJ}{kg} \right)}{CV_{coal} \left(\frac{MJ}{kg} \right)} \times \frac{(CE \times TE)_{biomass\ boiler}}{(CE \times TE)_{coal\ boiler}}$$

Equation 13

$$CO_2\ emissions_c \left(\frac{tonne}{year} \right) = Coal\ burnt \left(\frac{tonne}{year} \right) \times IPCC\ EF_c \left(\frac{tonne\ CO_2}{tonne\ coal} \right)$$

Equation 14

$$CO_2\ eq\ of\ N_2O\ emissions_c \left(\frac{tonne}{year} \right) = Coal\ burnt \left(\frac{tonne}{year} \right) \times IPCC\ EF_c \left(\frac{tonne\ N_2O}{tonne\ coal} \right) \times GWP\ of\ N_2O$$

Equation 15

$$CO_2\ eq\ of\ CH_4\ emissions_c \left(\frac{tonne}{year} \right) = Coal\ burnt \left(\frac{tonne}{year} \right) \times IPCC\ EF_c \left(\frac{tonne\ CH_4}{tonne\ coal} \right) \times GWP\ of\ CH_4$$

Assumptions:

- It is estimated that by year 4 an additional 250 tonnes of biomass per day will be burnt in the boiler.
- For the purpose of the calculation it is assumed that 71.4 tonnes of coal per day would have continued to be burnt. The biomass replaces all the coal currently being used.

Calculation example for baseline emissions from Project Activity 2:**From equation 23:**

$$\begin{aligned}
 \text{Coal burnt} \left(\frac{\text{tonne}}{\text{day}} \right) &= 250 \left(\frac{\text{tonne}}{\text{day}} \right) * \frac{8 \left(\frac{\text{MJ}}{\text{kg}} \right)}{27.5 \left(\frac{\text{MJ}}{\text{kg}} \right)} \times \frac{(83.7 \times 91)_{\text{biomass boiler}}}{(85.3 \times 91)_{\text{coal boiler}}} \\
 &= 71.4 \left(\frac{\text{tonne}}{\text{day}} \right) \dots\dots 27
 \end{aligned}$$

From equation 24:

$$\begin{aligned}
 \text{CO}_2 \text{ emissions}_c \left(\frac{\text{tonne}}{\text{year}} \right) &= \text{Coal burnt} \left(\frac{\text{tonne}}{\text{year}} \right) \times \text{IPCC EF}_c \left(\frac{\text{tonne CO}_2}{\text{tonne coal}} \right) \\
 &= 71.4 \left(\frac{\text{tonne}}{\text{day}} \right) \times 350 \left(\frac{\text{days}}{\text{year}} \right) \times 2.465 \left(\frac{\text{tonne CO}_2}{\text{tonne coal}} \right) \\
 &= 59458 \left(\frac{\text{tonne}}{\text{year}} \right) \dots\dots 28
 \end{aligned}$$

From equation 25:

$$\begin{aligned}
 \text{CO}_2 \text{ eq of N}_2\text{O emissions}_c \left(\frac{\text{tonne}}{\text{year}} \right) &= \text{Coal burnt} \left(\frac{\text{tonne}}{\text{year}} \right) \times \text{IPCC EF}_c \left(\frac{\text{tonne N}_2\text{O}}{\text{tonne coal}} \right) \times \text{GWP of N}_2\text{O} \\
 &= 71.4 \left(\frac{\text{tonne}}{\text{day}} \right) \times 350 \left(\frac{\text{days}}{\text{year}} \right) \times 0.000275 \left(\frac{\text{tonne N}_2\text{O}}{\text{tonne coal}} \right) \times 310 \text{ (GWP of N}_2\text{O)} \\
 &= 211 \left(\frac{\text{tonne}}{\text{year}} \right) \dots\dots 29
 \end{aligned}$$

From equation 26:

$$\begin{aligned}
 \text{CO}_2 \text{ eq of CH}_4 \text{ emissions}_c \left(\frac{\text{tonne}}{\text{year}} \right) &= \text{Coal burnt} \left(\frac{\text{tonne}}{\text{year}} \right) \times \text{IPCC EF}_c \left(\frac{\text{tonne CH}_4}{\text{tonne coal}} \right) \times \text{GWP of CH}_4 \\
 &= 71.4 \left(\frac{\text{tonne}}{\text{day}} \right) \times 350 \left(\frac{\text{days}}{\text{year}} \right) \times 0.000044 \left(\frac{\text{tonne CH}_4}{\text{tonne coal}} \right) \times 21 \text{ (GWP of CH}_4\text{)} \\
 &= 23 \left(\frac{\text{tonne}}{\text{year}} \right) \dots\dots\dots 28
 \end{aligned}$$

Table 10: Summary of Project activity 2 Baseline emissions

Project Activity 2 Baseline				
<i>Emission Source</i>	<i>Quantity</i>	<i>Energy equivalent</i>	<i>Emissions intensity</i>	<i>CO₂ emissions</i>
		<i>GigaJoules</i>	<i>tonnes CO₂/tonne</i>	<i>kilotonnes</i>
Coal used in boiler year 1	9646 tonnes/year	27.5 GJ/tonne coal	2.465 from CO ₂ 2.75E-05 from N ₂ O 4.4E-05 from CH ₄	23.7 0.082 0.009
Coal used in boiler year 2	14469 tonnes/year	27.5 GJ/tonne coal	2.465 from CO ₂ 2.75E-05 from N ₂ O 4.4E-05 from CH ₄	35.7 0.123 0.013
Coal used in boiler year 3	19292 tonnes/year	27.5 GJ/tonne coal	2.465 from CO ₂ 2.75E-05 from N ₂ O 4.4E-05 from CH ₄	47.6 0.164 0.018
Coal used in boiler years 4 to 10	24115 tonnes/year	27.5 GJ/tonne coal	2.465 from CO ₂ 2.75E-05 from N ₂ O 4.4E-05 from CH ₄	59.5 0.206 0.022
Subtotal (for 10 years)				525.234

E.1.2.5 Difference between E.1.2.4 and E.1.2.3 represents the emission reductions due to the project activity during a given period is estimated to be **1217 kilotonnes CO₂ equivalent**.

E.2 Table providing values obtained when applying formulae above:

Table 11: Summary of emissions for Project Activities and Baselines

Total CO ₂ equivalent emissions	
<i>Source</i>	<i>CO₂ emissions kilotonnes</i>
Project Activity 1	0
Project Activity 1 Baseline	707
Project Activity 2	153.9
Project Activity 2 Baseline	525
Leakage	-
Total emissions reductions over 10 years	1217

F. ENVIRONMENTAL IMPACTS

F.1 If required by the host Party, documentation on analysis of the environmental impacts of the project activity

1. Reduction in GHG emissions from fossil fuel (coal) burning
2. Reduction in fly and coarse ash to landfill resulting in longer lifespan of the landfill site
3. Less biomass to municipal landfill site which will prevent CH₄ emissions from landfill
4. No significant impact on water consumption or water disposal
5. Opportunities for job creation (SMME)

Confirmation was received from the Department of Agriculture and Environmental Affairs that in terms of the Environmental Conservation Act Section 21 and Section 22, a full EIA is not necessary. Mondi Richards Bay has embarked on a public participation exercise where stakeholders were invited to attend a presentation on the project and to deliver comments for discussion and follow up. Representatives from the local authorities (including the Health Department and the Air Quality Department), the Richards Bay Clean Air Association and the ratepayers attended the presentation. The scope and technicalities of the project were discussed and questions from the stakeholders were answered. The only comment received was that Mondi should present the impact of the project after implementation to stakeholders to serve as an example to other industries in the area. Mondi agreed to implement this recommendation.

G. STAKEHOLDERS COMMENTS

G.1 Brief description of the process by which comments by local stakeholders have been invited and compiled

An advertisement was placed in the local newspaper to invite stakeholders to participate in a presentation of the biomass project that was held at the Mondi Forum meeting. Comments were invited and recorded. Representatives from the ratepayers association, the local authority including the health department attended. The Department of Agriculture and Environmental Affairs confirmed that the scope of the project is such that an EIA is not required .

G.2 Summary of the comments received

The only comment received was from the ratepayers representative who indicated that the project sets an example for industry in the area. A request was received from the local authority that a presentation should be given to the Forum members once the project has been implemented. This was agreed to by Mondi.

G.3 Report on how due account was taken of any comments received

Refer to the comments in Section F

Annex 2

INFORMATION REGARDING PUBLIC FUNDING

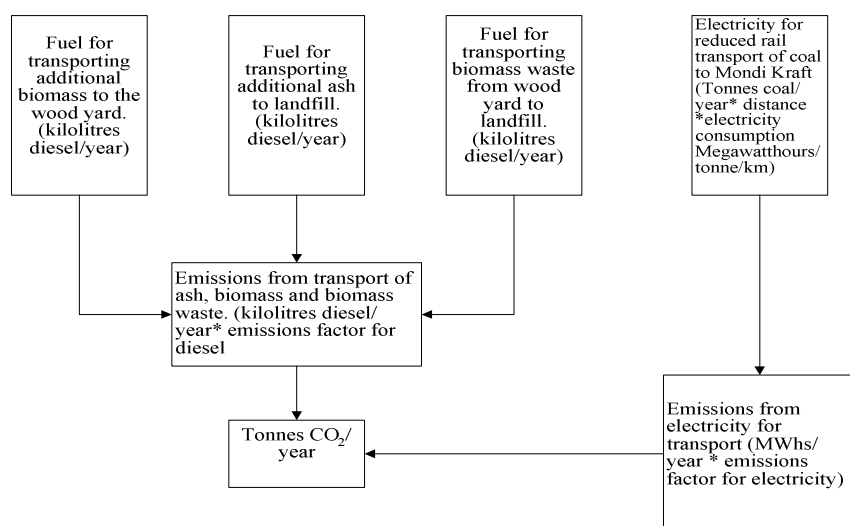

There is no public funding involved in the project.

Annex 3

LEAKAGE CALCULATIONS (estimations of leakage - not required in the small-scale type included here)

1. It is assumed that 25% of the biomass will be coming from local sources in Richards Bay and 75% of the sources will be from farmers situated up to 40 to 50 kilometres from Richards Bay - an average of 25 kilometres will be used in calculations.
2. Landfill emissions related to transporting ash from Richards Bay mill to the Mondi owned landfill site are disregarded because the amount of ash landfilled will reduce as biomass produces less ash than coal would. Disregarding these emissions is in keeping with the conservative baseline.

The calculation steps below estimates the emissions attributable to changes in road and rail transport as a result of the project activity.

Calculation of transport emissions

Table 12: *Information for calculating transport emissions*

CO ₂ emission factor for diesel	3.77kgs CO ₂ /litre (86.3% by mass Carbon and Specific gravity of 0.84) (Ref: Kinsky, R. (1997): Thermodynamics: Advanced Applications, McGraw-Hill, Sydney, p.66)
Ash in bituminous coal	13-16% (ref: Carbon Fuels, Paarl)
Diesel consumption	0.56 litres/tonne/km (ref: Mondi contractors)
Electricity consumption for coal transport	12.86 Wh/tonne/km (For the Coalline these figures are 18,82 and 12,86 for the DC and AC sections respectively, For the lakage the lower of the two values were used, JP du Plessis Pr Eng, Principal Engineer, Valuation, Acquisition and Review) Spoornet, pers comms, Feb 27, 2003.
Specific Gravity of Diesel	0.84
Carbon content of Diesel	86.3%

Table 13: *Emissions from Leakage*

Project Leakage					Reference
<i>Emission Source</i>	<i>Quantity (tonnes)</i>	<i>Distance travelled (kms)</i>	<i>Emissions intensity</i>	<i>CO₂ emissions</i>	
	<i>tonnes</i>	<i>kms</i>	<i>l/tonne km</i>	<i>Kilotonnes</i>	
Leakage description
